SOEP Survey Papers
Series D – Variable Descriptions and Coding

SOEP-Core v37 – PGEN: Person-Related Status and Generated Variables

SOEP Group

Running since 1984, the German Socio-Economic Panel (SOEP) is a wide-ranging representative longitudinal study of private households, located at the German Institute for Economic Research, DIW Berlin.

The aim of the SOEP Survey Papers Series is to thoroughly document the survey's data collection and data processing. The SOEP Survey Papers is comprised of the following series:

Series A – Survey Instruments (Erhebungsinstrumente)
Series B – Survey Reports (Methodenberichte)
Series C – Data Documentation (Datendokumentationen)
Series D – Variable Descriptions and Coding
Series E – SOEPmonitors
Series F – SOEP Newsletters
Series G – General Issues and Teaching Materials

The SOEP Survey Papers are available at <http://www.diw.de/soepsurveyspapers>

Editors:

inputdataset – Source dataset	67

1 General Information

The PGEN-files contain user friendly data on the individual level which are consolidated from different sources in long format. The plausibility is in many respects longitudinally validated, therefore the data here are in most situations superior compared to the data in PL or \$P.

The file contains one row for each person (PID) and surveyyear (SYEAR) (each combination of PID and SYEAR is unique) with a completed personal or youth questionnaire. These are the persons where NETTO in PPFADL has the values 10–17 or 19 which is equivalent for values 1 and 5 in NETT1.

The same content can be found in the wave specific \$PGEN files. The variable names are similar and differ especially in prefixes and suffixes.

In 2017 the file contains information about two special groups of first-time respondent refugee teenagers. First group of 143 respondents (netto 29) is analogous to 2016, part of the household questionnaire and the data are stored in the child dataset. The second group contains 108 individuals of age 16-17 from refugee sample, who received a special questionnaire. These respondents are part of youth dataset JUGENDL and can be identified by the instrument indicator value 73.

From version v34 on, PGAUTONO is not a part of data delivery.

From version v32 on, PGERWTYP is not a part of data delivery. The information related to PGERWTYP categories can be found in the variable(s) PGJOBCH, PGEMPLST, PGLFS.

2 Identifiers

pid – Never Changing Person ID

The central individual identifier across time is PID, which is fixed over time (and of course datasets).

hid – Current Wave HH Number

This identifier groups all persons into households at the time of the most recent wave.

cid – Original Houshold Number, Case ID

The identifier of the household, when it is sampled and selected for interviewing for the first time. The CID is attached to all persons living in this household and all new persons inherit this identifier, when they are born or move in a SOEP household. It is fixed no matter how often a person changes the household in the course of time.

syear – Survey Year

1984	12245
1985	11090
1986	10646

-7	Only available in less restricted edition	0

Waves: all

This variable is designed to integrate the information on respondent's nationality for all subsamples. Since some members of Sample B (persons with Turkish, Italian, Spanish, Greek, and Yugoslavian citizenship) received the question items in their own language up to 1995, to carry out an integrated analysis with Sample B, the user must obtain this information from the corresponding \$PAUSL files and add it to the individual data. The variable PGNATION thus offers a variable on nationality for all subsamples.

For more information, contact: Peter Krause (Tel. +49-30-89789-690)

pgstatus_asyl – Status quo, Application for Asylum

1	[de] Schutzstatus zuerkannt (Anerkannter Fluechtling, Asylberechtig, anderer Schutzstatus)	4999
2	Temporary Suspension of Deportation	513
3	Request to Leave Germany	343
4	Decision Regarding Residential Status Still Open	1948
-1	No answer	103
-2	Does not apply	27316
-5	Not Included In Questionnaire Version	27913
-7	Only available in less restricted edition	0
-8	Question this year not part of survey	687305

This variable provides data on the current status of the application for asylum. The data are obtained by asking respondents if their application for asylum has been approved and if an official decision regarding the application for asylum has been made. Please also see pgstatus_refu and the variable arefbac in the dataset ppfadl.

For more information, contact: Jana Nebelin (Tel. +49 30 89789-319; jnebelin@diw.de)

pgstatus_refu – Refugee residence status

1	In Proceedings	2459
2	[de] Schutzstatus zuerkannt (Asyl, Fluechtlingseigenschaft, Niederlassungserlaubnis, human. Aufnahme, sonst. human. Aufnahme)	6381
3	Temporary Suspension of Deportation	559
4	Other	467
-1	No answer	170
-2	Does not apply	25186
-5	Not Included In Questionnaire Version	27913
-7	Only available in less restricted edition	0
-8	Question this year not part of survey	687305

This variable provides data on the current status of the refugee. The data are obtained by asking respondents for their current residence title. Please also see `pgstatus_asyl` and the variable `arefbck` in the dataset `ppfadl`.

For more information, contact: Jana Nebelin (Tel. +49 30 89789-319; jnebelin@diw.de)

4 Family Status and Partnership

`pgpartz` – Partner Indicator

0	No partner	235659
1	Spouse, registered partner	448995
2	Partner	62598
3	Probably spouse, registered partner	953
4	Probably partner	1647
5	not clear	588
-1	No answer	0
-2	Does not apply	0
-3	Not valid	0
-4	Forbidden Multiple Response	0
-5	Not Included In Questionnaire Version	0
-6	Questionnaire Version With Modified Filter	0
-7	Only available in less restricted edition	0

Waves: all

The variable `PGPARTZ` generated in the context of the partner identifier (`PGPARTNR`) to describe whether a person in a SOEP household has a partner in that household, and if so, the type of relationship existing between the partners. Relationships with persons outside the SOEP household are not covered by this variable.

To explain the codes:

Code 0 is assigned to all single persons living in households and those with partners outside the household. Codes 1 to 4 describe relationships. To assign Codes 1 and 2, the partnership has to be definable from the perspective of both partners unanimously. If conflicting information exists between partners, the codes 3 or 4 are assigned. If it is unclear whether an individual has no partner or whether she forms a couple with one other household member, we assign the code 5. Registered partnerships (civil unions) for same-sex couples were introduced in Germany in 2001. Though, registered partnerships are legally not equal to marriage, they are listed in the same category.

For more information, contact: Martin Kroh (Tel. +49-30-89789-678)

`pgpartnr` – Partner Person Number

-1	No answer	0
-2	Does not apply	236238
-3	Not valid	0
-4	Forbidden Multiple Response	0
-5	Not Included In Questionnaire Version	0
-6	Questionnaire Version With Modified Filter	0
-7	Only available in less restricted edition	0

Waves: all

Partner indicators have the purpose of defining couples in SOEP households and thus to make possible analyses on the dyadic level. Persons without spouse and (cohabitating) partner receive a missing code “-2” (=does not apply). Also, the variable PGPARTZ is coded 0, 3, 4, 5 in these cases. In couples, PGPARTNR is the value of the unchanging person ID number (=PID) of the partner. The assignment of the partner ID within households is based on four sources of information: A question in the person-file, that asks (unmarried) respondents to identify their partner in the household (BHPPNR in 2017, PLK0001 in PL), the household matrix reported by the head of household at the beginning of the interview (BHSTELL in 2017, STELL_V1, STELL_V2, STELL_H in PBRUTTO), the partnership biography in the life-history calendar reported by new respondents (see also, biomars), and self-reports on marital status and life events, such as marriage, move in with partner, separation, etc. In unclear cases, due to temporal non-response for instance, we also consider longitudinal information from previous and prospective waves. Moreover, PGPARTNR is self-consistent between two individuals. For analyses of partner relationships, this information can be used to link all persons with their respective partners, and all information on both partners can also be stored in a common dataset.

For more information, contact: Martin Kroh (Tel. +49-30-89789-678)

pgfamstd – Marital Status In Survey Year

1	Married	445292
2	Married, But Separated	16131
3	Single	185495
4	Divorced	52162
5	[de] Verwitwet / Lebenspartner/-in aus eingetragener gleichgeschlechtlicher Partnerschaft verstorben	42632
6	husband/wife abroad	2036
7	Registered Same-Sex Partnership, Living Together	767
8	Registered Same-Sex Partnership, Living Apart	128
-1	No answer	2711
-2	Does not apply	0
-3	Not valid	3078
-4	Forbidden Multiple Response	0
-5	Not Included In Questionnaire Version	8
-6	Questionnaire Version With Modified Filter	0
-7	Only available in less restricted edition	0
-8	Question not part of the survey program this year	0

Waves: all

Marital status is describing the institutional status of marriage at the time of the person interview. Marital status is based on information given by the respective person on his or her current relationship as well as on retrospective information about previous relationships asked in the biography questionnaire. Information on marital status when a child was born (provided in the biography information) is not used here, so contradicting information to file BIOBIRTH might still be possible. For those whose partner was identified within the household, marital status is counter-checked with the information given by the partner. Where contradictions can be found, indication of the person information is compiled if reasonable. If no information is available, the indication by position related to head of household is deferred. Remaining contradictions are solved using information on marriage status when a child was born as well as future reports on a given relationship. Marital status is only

available for people, who were interviewed. Data on marital status provided here is generated from and hence consistent with the corresponding BIOMARSY file, although value labels differ between PGFAMSTD and SPELLTYP in BIOMARSY. Note that marital status in a specific wave can be different between data distributions due to consistency checks using up-to-date information from following waves. Because of the newly introduced construction process of BIOMARSY, changes might be more than usual. Above, the partner indicator PGPARTZ supplied here in dataset PGEN as well might not match the information provided in PGFAMSTD in its entirety.

For more information, contact: Paul Schmelzer (Tel. +49-30-89789-526, pschmelzer@diw.de)

5 Wages and Salary

pglabgro – Current Gross Labor Income in Euro

-2	Does not apply	306313
-5	Not Included In Questionnaire Version	5286
-7	Only available in less restricted edition	0

Waves: all

The variable PGLABGRO represents the imputed gross labor income in the previous month generated for all SOEP respondents who are employed in a main job in each respective wave. Interviewees should consider overtime payments but no irregular one-time payments such as holiday or bonuses. Income details are consistently provided in euros for all waves. Item nonresponse is imputed in a two-stage procedure: first, with the “Row-and-Column” method of Little und Su (1989) using individual longitudinal data as well as cross-sectional trend data (cf. Joachim R. Frick and Markus M. Grabka (2005): Item-Non-Response on Income Questions in Panel surveys: Incidence, Imputation and the Impact on the Income Distribution. Allgemeines Statistisches Archiv (ASTA) 89, 49-61). Alternatively, if no individual longitudinal information is available, we base the imputation on a regression using different Mincer covariates, also taking into account current net labor income. If both types of income information are lacking, first we impute current net labor income and then current gross labor income. Imputed values are flagged (PGIMPGRO).

The corresponding variables in file PL are PLC0013_V1 and PLC0013_V2. The original variables coming from the \$P files are: ap3301, bp4301, cp5201, dp4401, ep4401, fp4501, gp4301, hp5401, ip5401, jp5401, kp6401, lp5301, mp4701, np5401, op4501, pp6001, qp5601, rp5701, sp5801, tp7601, up5901, vp7101, wp5901, xp7301, yp6801, zp7201, bap6101, bbp7301, bcp5901, bdp7701, bep5701, bfp10201, bgp8101, bhp_97_01.

For more information, contact: Markus Grabka (Tel. +49-30-89789-339 / mgrabka@diw.de)

pgimpgro – Imputation flag for LABGROxx

0	Not imputed	393049
1	Imputed	45792
-1	No answer	0
-2	Does not apply	306313
-3	Not valid	0
-4	Forbidden Multiple Response	0
-5	Not Included In Questionnaire Version	5286
-6	Questionnaire Version With Modified Filter	0

-7 Only available in less restricted edition 0

Waves: all

The variable PGIMPGRO designates imputations of item non-response in the variable PGLABGRO (current gross labor income). The value -2 (does not apply) can be interpreted as “not working”.

For more information, contact: Markus Grabka (Tel. +49-30-89789-339 / mgrabka@diw.de)

pglabnet – Current Net Labor Income in Euro

-2 Does not apply 306314
 -5 Not Included In Questionnaire Version 5286
 -7 Only available in less restricted edition 0

Waves: all

The variable PGLABNET represents the imputed net labor income in the previous month in a main job of all persons in SOEP working in the respective wave. Interviewees should consider overtime payments but no irregular one-time payments such as holiday or bonuses. Income details are consistently provided in euros for all waves. The imputation of item non-response takes place in a two-stage procedure: first, with the “Row-and- Column” method of Little und Su (1989) using individual longitudinal data as well as cross-sectional trend data (cf. Joachim R. Frick and Markus M. Grabka (2005): Item-Non-Response on Income Questions in Panel surveys: Incidence, Imputation and the Impact on the Income Distribution. Allgemeines Statistisches Archiv (ASTA) 89, 49-61). Alternatively, if no individual longitudinal information is available, we base the imputation on a regression using different Mincer covariates, also taking into account current gross labor income. If both types of income information are lacking, first we impute current gross labor income and then current net labor income.

Imputed values are flagged (PGIMPNET).

The corresponding variables in file PL are PLC0014_V1 and PLC0014_V2. The original variables coming from the \$P files are: ap3302, bp4302, cp5202, dp4402, ep4402, fp4502, gp4302, hp5402, ip5402, jp5402, kp6402, lp5302, mp4702, np5402, op4502, pp6002, qp5602, rp5702, sp5802, tp7602, up5902, vp7102, wp5902, xp7302, yp6802, zp7202, bap6102, bbp7302, bcp5902, bdp7702, bep5702, bfp10202, bgp8102, bhp_97_02.

For more information, contact: Markus Grabka (Tel. +49-30-89789-339 / mgrabka@diw.de)

pgimpnet – Imputation flag for LABNETxx

0 Not imputed 406251
 1 Imputed 32589
 -1 No answer 0
 -2 Does not apply 306314
 -3 Not valid 0
 -4 Forbidden Multiple Response 0
 -5 Not Included In Questionnaire Version 5286
 -6 Questionnaire Version With Modified Filter 0
 -7 Only available in less restricted edition 0

Waves: all

The variable PGIMPNET designates imputations of item non-response in the variable PGLABNET (current net labor income). The value -2 (does not apply) can be interpreted as “not working”.

For more information, contact: Markus Grabka (Tel. +49-30-89789-339 / mgrabka@diw.de)

pgsndjob – Current Gross Secondary Income In Euro

-2	Does not apply	447641
-5	Not Included In Questionnaire Version	271845
-7	Only available in less restricted edition	0

Waves: 1995-2016

The variable PGSNDJOB represents the imputed current gross labor income from second job generated for all SOEP respondents in each respective wave. Income details are consistently provided in euros for all waves. Item nonresponse is imputed in a two-stage procedure: first, with the “Row-and-Column” method of Little und Su (1989) using individual longitudinal data as well as cross-sectional trend data (cf. Joachim R. Frick and Markus M. Grabka (2005): Item-Non-Response on Income Questions in Panel surveys: Incidence, Imputation and the Impact on the Income Distribution. Allgemeines Statistisches Archiv (ASTA) 89, 49–61). Alternatively, if no individual longitudinal information is available, we base the imputation on a regression using a subset of different Mincer covariates. Information about gross income from second job is firstly asked in wave 1995 (L). In 2013 information about income from second jobs was not collected for sub-sample M. We use information from the the subsequent survey year (2013) about income from second job in the previous year (variable BEP2C03). If persons from the sub-sample M stated that he/she had income in the previous year from second jobs, then PGIMPSND in year 2013 was set to -1 and PGSNDJOB had been imputed. Imputed values are flagged (PGIMPSND).

The corresponding variables in file PL are PLC0062_V1 and PLC0062_V2. The original variables coming from the \$P files are: lp7702, mp5802, np5802, op4902, pp6602, qp6302, rp6602, sp6602, tp8402, up67, vp79, wp70, xp81, yp76, zp78, bap69, bbp79, bcp67, bdp85, bep64, bfp113, bgp97.

For more information, contact: Markus Grabka (Tel. +49-30-89789-339 / mgrabka@diw.de)

pgimpsnd – Imputation Flag For SNDJOBxx

0	Not imputed	27842
1	Imputed	3112
-2	Does not apply	447641
-5	Not Included In Questionnaire Version	271845
-7	Only available in less restricted edition	0

Waves: 1995-2016

The variable PGIMPSND designates imputations of itemnonresponse in the variable PGSNDJOB\$\$ (current gross labor income from second job). The value -2 (does not apply) can be interpreted as “not working”.

For more information, contact: Markus Grabka (Tel. +49-30-89789-339 / mgrabka@diw.de)

The variable PGSNDJOB1 represents the imputed gross labor income from a first side job. This information is collected for the first time since 2017. Item nonresponse is imputed in a two-stage procedure: first, with the “Row-and-Column” method of Little und Su (1989) using individual longitudinal data as well as cross-sectional trend data. Alternatively, if no individual longitudinal information is available, we base the imputation on a regression using different Mincer covariates. Imputed values are flagged (PGIMPSNDJOB1).

For more information, contact: Markus Grabka (Tel. +49-30-89789-339 / mgrabka@diw.de)

Waves: all

The variable represents a compilation of all relevant information on current occupational position. It is generated by combining information on “occupational group”, “unemployed (yes/no)”, “military/community service”, “in education (yes/no)”, and “pensioner”. A hierarchical scheme is used to determine which data is given precedence when a variety of divergent information exists (increasing dominance):

value	label
10	not employed
13	pensioner
11	currently in education
15	military / community service
12	registered unemployed
110-150	apprentice
410-440	self-employed
210-250	manual laborer
510-550	employee
610-640	civil service

The categories (150) and (310) to (340) were only assigned to respondents in East Germany in 1990. In PGSTIB, non-working persons are only assigned to the category (13) “pensioner” if they are recipients of retirement pension or if they are recipients of widow’s pension AND are older than 60 years. Moreover, if there is missing information on pension receipt, additional information from file ARTKALEN (retrospective information from the activity calendar for the previous year) is used in the generation process to determine if a person was in retirement or early retirement (Vorruhestand) at the time of the interview.

The code (-2) is assigned to first time respondents aged 16 or 17 who answer the youth questionnaire.

Since 2014 it has been possible that self-employed people (410–440) leave missing the number of employees or co-workers. These observations are then assigned to their respective primary categories (410, 420 and 430) which were otherwise valid from 1984 until 1999.

-7	Only available in less restricted edition	0

Waves: all

This variable is generated from the annual question on current employment status, which has a central filter function in the questionnaire to separate employed people from non-employed people for further questions. It is designed to provide consistent longitudinal data on employment status across all waves.

Since the beginning of the SOEP in the year 1984, a consistent status variable has been used to differentiate among different types of employment status. The category “not employed” comprises non-working individuals, those in military/community service, those on maternity leave, and employed persons in a phased retirement scheme (*Altersteilzeit*) whose current actual working hours are zero. From 1998 on, the additional category “sheltered workshop” is included for disabled persons in sheltered employment.

PGEMPLST supplements the variable PGLFS, which differentiates among persons who are not employed.

The information about newly included teenager refugee sample special groups in 2017 is taken from child and youth datasets. In case the teenagers do not attend school, they were asked about the alternative status. Those teenagers who attend school, are in vocational preparational year or in a vocational training, or in vocational school were assigned value of 3. Those waiting for the start of the school term of vocational training, are categorized as 1. In case the teenagers do not attend school and are working the respondents were classified to category 3. This information also applies for first-time teenage respondents in 2016 (who were previously treated as missings).

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

pglfs – Labor Force Status

1	Non-working (NW): without further information	90186
2	NW: age 65 and older	109672
3	NW: and currently in training/education	31983

10	NW: but regular secondary job (1985-2016)	7540
11	Working	434670
12	Working, but inactive within past 7 days (since 2000)	5700
13	NW: but paid secondary job (since 2017)	1520
-1	No answer	1
-2	Does not apply	79
-3	Not valid	0
-4	Inadmissible multiple response	0
-5	Not included in this version of the questionnaire	0
-6	Version of questionnaire with modified filtering	0
-7	Only available in less restricted edition	0

Waves: all

This variable is based on the annual question on current employment status, combined with additional information on activities of non-working individuals. The number of values assigned has been based, since the beginning of the SOEP in the year 1984, on a large number of highly differentiated answer categories. It is designed to provide consistent longitudinal data on labor force participation across all waves.

PGLFS provides a differentiation between “working” (Code 11–12) and “non-working” (Code 1–10,13), categories which are constant over all waves. Non-employment is subdivided further in order to make it possible to efficiently apply different labor market concepts in studying the data. To calculate this variable, the variables on employment status, age, maternity leave, secondary jobs, registration at the employment office, participation in paid work during the past 7 days and training status are used.

For respondents who have multiple status codes and different values for this variable, the following hierarchy was used to determine which of the values would play the determining role (increasing dominance):

value	label
1	Non-working (NW): without further information
2	NW: age 65 and older
3	NW: and currently in training/education
6	NW: and registered unemployed
4	NW: on parental leave
5	NW: in military/community service
8	NW: but occasional secondary job
10	NW: but regular secondary job
9	NW: but paid work in past 7 days
13	NW: but paid secondary job
11	Working
12	Working, but inactive within past 7 days

Since 2016, the questionnaire for refugees contains a new labor market status category “vocational internship (Ger: betriebliches Praktikum)”, which is integrated in the category 3 “non-working, and currently in training/education” of PGLFS.

Since 2017 there is no differentiation between regular and occasional secondary job. Category 13 is therefore created to capture the respondents who are primarily not part of the labor force but either regularly or occasionally exercise one or more secondary activities which are either remunerated or not voluntary.

PGLFS supplements the variable PGEMPLST, which differentiates among persons who are employed.

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

-5	Not Included In Questionnaire Version	0
-6	Questionnaire Version With Modified Filter	0
-7	Only available in less restricted edition	0

Waves: all

This variable indicates a change of job since the previous interview for respondents with a follow-up interview, whereas for first-time respondents, the information refers to a change of job since the beginning of the previous year.

PGJOBCH is generated based on the central filter variable, which indicates whether a respondent has changed jobs since the beginning of the previous year. A job change can be within one firm as well as a change to another firm. Information on the date of job change is then combined with interview month of the previous year's interview to identify whether a new job change has taken place since the previous interview.

Hence, PGJOBCH indicates whether a respondent has changed jobs since the beginning of the previous year. The variable is calculated for all waves, and the codes are assigned independently of the respondent being a first-time or follow-up respondent.

The variable is also designed to identify respondents who have entered employment for the first time. Up to 1993, first-time respondents did not answer the question about job change. Therefore, for first-time respondents up to 1993, the variable was generated by using the information on the start date with the current employer and the respondent's age at entrance into his/her first job.

The variable is also designed to provide consistent longitudinal information on job changes. The PGJOBCH variable is generated by correcting the original job change information in various ways:

1. We check whether the job changes stated by a respondent in two consecutive interviews refer to one and the same job change. The date of the job change and the interview month are used to correct double entries.
2. If the respondent indicates a job change with a date before the previous interview but did not state a job change in the previous interview, this is coded as a job change in the current interview.
3. If a respondent indicates no job change and was not employed at the time of the previous interview, this is coded as "no job change" despite the seeming implausibility, since there are possible explanations how this information could be plausible, e.g. if there were short-term employment spells between two interview dates.

4. Respondents can be “first-time employed” only once. If a respondent states being “first-time employed” for a second time, this is coded as “employed, with change”.

In 2013 the respondents of the newly introduced migration sample (M1) were not asked whether they have changed jobs since the beginning of the previous year, therefore the generation of PGJOBCH for the migration sample was modified in 2013:

1. Respondents who are not employed were coded (1).
2. Respondents who are still in the same occupation and position and are working for the same employer as they had worked in their first job in Germany were coded (2).
3. Respondents who have entered the firm they are currently working after the 31st of December 2011 were coded (4).
4. If a respondent is in her first vocational training this was coded as (5).
5. Respondents who are employed but for whom no further information could be used were coded (3). In 2014 there was again a uniform questionnaire for all respondents.

In 2015 the respondents of the newly introduced migration sample (M2) were not asked whether they have changed jobs since the beginning of the previous year. Furthermore respondent within migration sample M1 are decomposed in first-time respondents with and follow-up respondents without question about job change in the previous year embodied by the questionnaire. such that generation of PGJOBCH for the migration sample in 2015 was following:

1. For follow-up respondents generation as in case of a uniform questionnaire for all respondents to be pursued.
2. In the case of first-time respondents in M1 sample and for all respondents from M2 sample the rule of thumb is as in 2013.

In 2016 the respondents of the newly introduced refugee samples (M3 and M4, psample==17) were not asked whether they have changed jobs since the beginning of the previous year. The generation of PGJOBCH for these samples corresponds to the rule of thumb is as for the first-time respondent in the M1 sample with one modification. In step 4, the code (5) was assigned to respondents who are currently in a vocational training, were not occupied prior to their arrival in Germany, had neither a vocational training, nor a university degree and are in their first occupational relationship in Germany.

2017 generation of the PGJOBCH for the newly added immigration sample [psample = 19] is analogous to that of 2016. As of refugee teenagers, those attending school or are currently in vocational preparation year (Berufsvorbereitungsjahr), in vocational training, working, ber. Eingliederungsjahrgang or berufsbildende Schule were assigned value 1. Those working were assigned jobch value 3.

7 Current Occupation

Not all employed persons are asked the question about occupation on an annual basis. In years with a partial survey – 1985, 1986, 1987, 1988, 1990 (West), 1992 (West), 1994, 1996, 1999, 2001, 2003, 2005, 2006, 2008, 2010, 2012, 2014, and 2016 – only those employed persons who changed jobs and first-time respondents are asked to provide up-to-date information. Therefore, in years with a partial survey or in case of non-response the variables in this section usually contain available information from the previous year (persons with PGJOBCH-category (2) “employed, no change”). For some persons without a job change who updated the information on their current occupation without being asked, up-to-date information is used. The scores which are derived from the occupational scores contain information on the last attained value.

The missing values in variables of codes for economic activities or occupations and derived scores (NACE, ISCO, KldB, ISEI, SIOPS, EGP, MPG) should be interpreted as follows. -1: there was a response, but no code could be assigned or no score could be derived, -2: there was no response which could have been coded and -8 means this type of code or score is not available for this year.

The information on the current occupation is not necessarily consistent to the current employment status, because they are based on different sources of information

Waves: 2013–

This variable reflects the (last reached) Standard International Socio-Economic Index of Occupational Status for all employed persons. The ISEI Index was developed in 1992 by Ganzeboom, De Graaf, Treiman, and De Leew based on information about income, education, and occupation. Technically, ISEI was created by scaling the ISCO classification. In contrast to the prestige scores of Ganzeboom and Treiman (1996) and Wegener (1988), ISEI is a measure of socio-economic status.

It is derived from the ISCO-08 code of the current occupation using the Stata ado derives-cores by Daniel Bela and Knut Wenzig which itself is based on SPSS algorithms from Ganzeboom and Treiman (2010).

Also available: occupational prestige scores (SIOPS, MPS) and occupational class (EGP).

Ganzeboom, Harry B.G.; Treiman, Donald J., "International Stratification and Mobility File: Conversion Tools." Amsterdam: Department of Social Research Methodology, <http://www.harryganzeboom.nl/ismf/index<2010-01-12>>.

Waves: 2013–

This variable gives the occupational prestige score developed by Wegener (1988) for all employed persons. Like the SIOPS prestige score, Wegener's prestige scale measures a person's

occupational prestige and was developed especially for use in the Federal Republic of Germany.

MPS08 is assigned based on ISCO-88 (using Christoph 2005), which is based on ISCO-08 (using Ganzeboom, Treiman 2010).

Also available: occupational prestige scores (SIOPS, ISEI) and occupational class (EGP).

Waves: 1984-2017

This variable reflects the Standard International Socio-Economic Index of Occupational Status for all employed persons. The ISEI Index was developed in 1992 by Ganzeboom, De Graaf, Treiman, and De Leuw based on information about income, education, and occupation. Technically, ISEI was created by scaling the ISCO-88 classification. The values for the variable range between 16 and 90. In contrast to the prestige scores of Ganzeboom and Treiman (1996) and Wegener (1988), ISEI is a measure of socio-economic status.

It is derived from the ISCO-88 code of the current occupation using the Stata ado *iskoisei* by John Hendrickx which itself is based on Harry Ganzeboom's SPSS algorithms.

Also available: occupational prestige scores (SIOPS, MPS) and occupational class (EGP).

For more information, contact: Knut Wenzig (Tel. +49 30 89789 341, kwenzig@diw.de)

Waves: 1984-2017

This variable gives the occupational class for all employed persons. It is derived from the ISCO-88 classification using Hendrickx's (2002) Stata ado. In addition, it is based on information on self-employment and number of employees (supervisory status). The EGP Index was documented by Ganzeboom/Treiman in 1996 and revised in 2003.

Information about supervisory status (number of employees of self-employed persons) is available from wave Q (2000) on. (This could lead to some minor longitudinal inconsistencies.)

Based on the new classification developed by Ganzeboom/Treiman (2003), several ISCO values were recoded in this variable as follows:

- ISCO 2470 becomes EGP=1.
- ISCO 2500 becomes EGP=2.
- ISCO 4300, 4400, 4500 become EGP=4.
- ISCO 7900 becomes EGP=7.
- ISCO 9910-9990 become EGP=9.

Please also see occupational status (PGISEI88) and occupational prestige scores (PGSIOPS88, PGMPS92) in file PL.

John Hendrickx, 2002. "ISKO: Stata module to recode 4 digit ISCO-88 occupational codes," *Statistical Software Components S425802*, Boston College Department of Economics, revised 20 Oct 2004. <https://ideas.repec.org/c/boc/bocode/s425802.html>

7	Technical College or University, until 98	10446
8	Technical College since 99	29460
9	University since 99	43736
-1	No answer	20549
-2	Does not apply	316640
-5	Not Included In Questionnaire Version	0
-7	Only available in less restricted edition	0

Waves: all

This variable is designed to provide annual data on required job training for all employed persons. The variable is generated using questions on required formal education and required on-the-job-training which are categorized into seven independent variables with 0/1 coding. Out of these, the highest available level of required training is used for the generation of the status variable.

The answer option “completed technical school” was only used from 1990 to 1993 in the East German version of the questionnaire. Since not all employed people are asked the question about required training every year, the value (6) of the variable PGAUSB is valid up to 1996. The code (-2) is assigned to all non-employed persons and also includes persons in occupational training, in occupational retraining programs, and those doing an internship at the time of the survey.

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

pgerwzeit – Length Of Time With Firm

-1	No answer	3723
----	-----------	------

-2	Does not apply	311891
-3	Not valid	93
-4	Forbidden Multiple Response	0
-5	Not Included In Questionnaire Version	0
-6	Questionnaire Version With Modified Filter	0
-7	Only available in less restricted edition	0

Waves: all

The variable PGERWZEIT is designed to offer data on the length of time with the firm at the point in time of the interview for all employed persons. This variable is generated from the respondent's start date with the current employer. In the case of a job change within the firm, the full length of time with the firm is calculated. Hence, the variable describes the length of time with the same firm and not the length of time in the same position.

The variable provides consistent longitudinal information on the length of time with the same employer. Data that show longitudinal inconsistencies are corrected, if it can be done under reasonable assumptions.

1. In case of no job change, the information on the start date with the current employer given in the earliest interview available is treated as dominant and carried forward to the subsequent years.
2. In case of a job change between firms, the information on the start of the current position is used and carried forward to the subsequent years.
3. Up to wave Z (2009), a respondent who starts working again after a period of non-employment is assumed to have returned to the former employer if the indicated start date with the current employer was before the previous interview date. In this case, the start date with the current employer given in the previous interview is treated as dominant. Otherwise, the present information on the start date with the current employer is used and carried forward to the subsequent years. For respondents who are assumed to have returned to their former employer, the full length of time with the firm is calculated. There is no deduction for the time during which the respondent was not employed.
4. Since wave BA (2010), there is a modified answer category in the questionnaire which indicates that a respondent returns to his/her former employer after a period of non-employment. If a respondent indicates to have started working again at a former employer, the present information on the start date with the current employer is used and carried forward to the subsequent years. Unlike before wave BA (2010), the present information is treated as dominant even if the indicated start date with the current employer was before the previous interview date. Hence, the full length of time with the firm is calculated, and there is no deduction for the time during which the respondent was not employed or employed in another firm.
5. The length of time with the firm is also provided for the East German sample since its start in 1990. Due to the massive restructuring of the economy that took place in East Germany after reunification, this variable should be dealt with cautiously in the first transition years.

Both monthly and annual information is used in the variables and rounded off as length of time in years (with months in decimal form).

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

pgtatzeit – Actual Work Time Per Week

-1	No answer	21649
-2	Does not apply	309114
-3	Not valid	1107
-7	Only available in less restricted edition	0

Waves: all

This variable provides data on actual weekly working hours (including overtime) for all persons employed at the time of the survey (including the self-employed). The data are obtained by asking respondents how many hours they work on average per week.

For implausible answers (actual weekly working hours of more than 80 per week), we assign the value (-3). The variable is rounded off and gives the number of working hours as a decimal number.

Please also see PGVEBZEIT and PGUEBSTD.

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

pgvebzeit – Agreed Upon Work Time Per Week

-1	No answer	46398
-2	Does not apply	346437
-3	Not valid	45
-7	Only available in less restricted edition	0

Waves: all

This variable provides data on agreed weekly working hours. The variable takes into account only those persons who were in dependent employment (not self-employed) at the time of the survey.

The value (-2) is assigned to non-employed people, employees without set hours and to self-employed people, including self-employed farmers, freelancers, and other self-employed persons. If persons helping out in family businesses report agreed weekly working hours, we assign a non-missing value.

For implausible answers (agreed weekly working time of more than 80 hours per week) we assign the value (-3). The variable is rounded off and gives the number of working hours as a decimal number.

Please also see PGTATZEIT and PGUEBSTD.

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

pguebstd – Overtime Per Week

0	No Overtime Last Month	204084
-1	No answer	16045
-2	Does not apply	357772
-3	Not valid	147
-7	Only available in less restricted edition	0

Waves: all

This variable provides data on overtime per week for all persons in dependent employment at the time of the survey. The data are obtained by asking respondents how many overtime

hours they worked in the month before the survey. The number of monthly overtime hours is then converted into weekly overtime by dividing the number given by 4.3. Since PGUEBSTD refers to weekly overtime during the last month, the number may deviate from the difference between average actual weekly working hours and the agreed weekly working hours.

In the years 1984, 1985 and 1987, respondents were not asked about number of hours of overtime per week. The variable PGUEBSTD for these years was therefore generated using the difference between average actual weekly working hours and agreed weekly working hours.

The value (-2) is assigned to non-employed people, employees without set hours and to self-employed people, including self-employed farmers, freelancers, and other self-employed persons. If persons helping out in family businesses report overtime hours, we assign a non-missing value.

For implausible answers (agreed-upon weekly working time or actual weekly working time of more than 80 hours per week AND weekly overtime of more than 10 hours we assign the value (-3).

The variable is rounded off and gives the number of overtime hours as a decimal number. Please also see PGVEBZEIT and PGTATZEIT.

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

Waves: 1984-2017

This variable is designed to provide annual data on the industry of economic activity for the company of all employed persons according to the Statistical Classification of Economic Activities in the European Community (Nomenclature des statistiques des activités économiques de la Communauté européenne - NACE Rev. 1.1 which is on this level similar to Rev. 1). Respondents answer the question in their own words regarding the industry in which they are currently working. If they don't report a jobchange, information from the previous year is used, cf. introduction to section in PDF-documentation for this file.

In order to facilitate international comparability, the European industry standard classification system is used by Kantar Public using Level 2 (Divisions) of the classification system. The classification has been documented in Hartmann/Schütz 2002.

The codes in NACE Rev.1 also correspond to ISIC Rev.3 (International Standard Classification of All Economic Activities).

Detailed description: Hartmann/Schütz (2002): Die Klassifikation der Berufe und der Wirtschaftszweige im Sozio-oekonomischen Panel. Neuvercodung der Daten 1984–2001. -1	No answer	20536
-2	Does not apply	308539
-7	Only available in less restricted edition	0

Waves: all

This variable provides data on the total size of the company (number of employees at all company locations).

Please pay attention to special codes 4, 5, and 8! These codes were necessary due to the differentiation of items for small and medium-sized companies over the years. In the years 1991, 1999, and 2005, respondents were asked about company size in a more detailed form, so when the data were recalculated for the years 1984–90, the original codes (1)–(5) were changed to (4)(8)(9)(10) and (11). For the years 1999 to 2004, Code (8) was differentiated into (6) and (7). From 2005 on, the prior category “5 to 20 employees” (5) has been split into the two categories “5 to 10 employees” (2) and “11 to 20 employees” (3).

In 2012, the questionnaire provides a one-time-only information on the size of the local establishment in addition to the size of the entire company (PGBETR). The enriched questionnaire revealed that in previous interviews, persons have mistakenly provided information on the local establishment size instead of the entire company size, especially if their entire company had 2000 and more employees. Due to the importance of longitudinal consistency, these persons were identified, and their 2012 original value of the entire company size was replaced by their value of the local establishment size. Furthermore, data of persons without a job change were modified if:

- the entire company size varies from 2011 to 2012,
- the local establishment size in 2012 matches the entire company size in 2011.

Those person’s values of the entire company in 2012 were replaced by their values of the local establishment size in 2012.

Please also see PGALLBET for a broader categorization of the firm size, which is appropriate for analyses that include all sample years.

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

-4	Forbidden Multiple Response	0
-5	Not Included In Questionnaire Version	0

-6	Questionnaire Version With Modified Filter	0
-7	Only available in less restricted edition	0

Waves: all

This variable is designed to provide annual data on the core size category of the company for all employed persons. Since respondents were asked about company size in more detailed form in the years 1991, 1999, and 2005 (see also PGBETR), the variable PGALLBET contains the lowest common denominator of the variable PGBETR, i.e., the firm size categories available across all SOEP waves. This broader categorization corresponds to the values of variables BETR84 to BETR90 and offers a variable that is consistent across all waves.

In order to maintain longitudinal consistency, there were modifications after a one-time change in the questionnaire in 2012. Please also see PGBETR for more information.

For more information, contact: Alexandra Fedorets (Tel. +49-30-89789-321, afedorets@diw.de)

-6	Questionnaire Version With Modified Filter	5024
-7	Only available in less restricted edition	0
-8		12245

Waves: 1985–

This variable is designed to offer annual data on reasons for an occupational change for all formerly employed persons, persons with a job change or persons on leave. For years 1985–1990 also persons who changed positions in the same company are considered. Only persons

with valid dates for an occupational or positional change are included. Likewise to the questionnaire the variable offers data from interview date to interview date not from one year to the following. Respondents are asked about their annual and possibly same occupational change in two consecutive interviews, duplicate answers are therefore considered only once and the older statement is dominant. If a respondent stated a job termination in the current interview which was before the interview date in the previous year but didn't reported this in the previous interview this termination has been counted for the current interview. For years 1985 up to 1998 every given reason was coded as separate variable with variable values "Yes" (1) and "Does not apply" (-2), which resulted in up to 13 different variables. Since 1999 all given reasons have been collected in one single variable with diverse values. If respondent states more than one reason for job termination, the first of the stated reasons is dominant. The year 1990 is specific due to introduction of sample for East Germany. Since the questionnaire did not contain the information on reasons for end of the job all the observations in Sample C in year 1990 obtained value (-5).

Please pay attention to special codes (15), (16), and (17)! These codes were necessary due to the variety of the given values over the years. In any years respondents were asked about reasons for change with more or less given answers and from years 1985–1998 also the answer "Other" was possible. While all explicit reasons have been recoded to uniform values, the answer "Other" then in some years includes reasons for which in other years was separately asked for: "Other" was coded (15) for years 1985 and 1986, (16) for years 1987–1990 and (17) for years 1991–1998.

For years 1991–1998 and 2011–2012 there is a variable value "Leave, maternity leave and parental leave" whereas for 1999–2010 the given reason covered only "Leave of absence/sabbatical". Note that codes (2) and (3) for years 1985–1998 have been merged to code (9) since 1999.

In 2013 the respondents of the newly introduced migration sample were not asked about an occupational change, but in 2014 they were. So information on jobend for the migration sample in 2013 were taken from the questionnaire in 2014.

Since 2006 youth questionnaires have been embodied in survey tools. Nevertheless, the questionnaires do not contain the information on jobend. Therefore, in order to account for the persons represented by the youth questionnaires the negative value (-5) has been introduced starting from year 2006.

-4	Forbidden Multiple Response	0
-5	Not Included In Questionnaire Version	0
-6	Questionnaire Version With Modified Filter	0
-7	Only available in less restricted edition	0

Waves: all

This variable reflects the total length of full-time employment in the respondent's career up to the point of the interview in a given year. The variable is created by combining monthly information on employment status from the calendar dataset ARTKALEN (which provides monthly information on activity status since an individual entered the SOEP) and annual

information from the biographical dataset PBIOSPE (which provides information on activity status over the individual's life course). PGEXPFT gives the length of time in years with months in decimal form.

If there is no monthly calendar data available in a given year of a respondent's career, the annual data from PBIOSPE is used for that year. In the most current wave the variable only uses up-to-date information from the newly answered Biography Questionnaires. If the year in which a spell started and ended is the same, and if there is no monthly data, a spell of 0.5 years is assumed. Persons without annual data (not contained in PBIOSPE) are only assigned a non-missing value for this variable if they joined SOEP by the age of 18 and if there is calendar data on them in ARTKALEN.

Persons whose life course has been observed completely but with no spell of full-time employment are assigned the code (0). The code (-1) is assigned to all persons whose life course has not been observed completely. Persons with inconsistent information receive a (-3).

Please also see PGEXPPT and PGEXPUE.

Waves: all

This variable reflects the total length of part-time employment in the respondent's career up to the point of the interview in a given year. The variable is created by combining monthly information on employment status from the calendar dataset ARTKALEN (which provides monthly information on activity status since an individual entered the SOEP) and annual information from the biographical dataset PBIOSPE (which provides information on activity status over the life course of an individual). PGEXPPT gives the length of time in years with months in decimal form.

If there is no monthly calendar data available in a given year of a respondent's career, the annual data from PBIOSPE is used for that year. In the most current wave the variable only uses up-to-date information from the newly answered Biography Questionnaires. If the year in which a spell started and ended is the same, and if there is no monthly data, a spell of 0.5 years is assumed. Persons without annual data (not contained in PBIOSPE) are only assigned a non-missing value for this variable if they joined SOEP by the age of 18 and if there is calendar data on them in ARTKALEN.

Persons whose life course has been observed completely but with no spell of full-time employment are assigned the code (0). The code (-1) is assigned to all persons whose life course has not been observed completely. Persons with inconsistent information receive a (-3).

Please also see PGEXPFT and PGEXPUE.

Waves: all

The educational variable (PGISCED97) classifies all correspondents' educational degrees according to the "International Standard Classification of Education (ISCED)" of 1997 in order

to make degrees internationally comparable. The variable is generated retrospectively from 1984 onwards taking into account degrees and diplomas attained in both general schooling and in vocational/university education and indicates the highest degree obtained. E.g., persons who did not indicate secondary school degrees/diplomas but a university degree are placed in the highest ISCED category. Please note that, due to a lack of more detailed information on tertiary degrees in earlier waves – in particular on PhD – we include all tertiary degrees in ISCED category 6. Thus, the ISCED variable provided here is not comparable one-to-one with the ISCED levels as defined by the OECD, since we have included the original ISCED level 5A in our ISCED category 6. OECD (1999): *Classifying Educational Programmes: Manual for ISCED-97 Implementation in OECD Countries*, Paris.

Waves: 2010–

The educational variable (PGISCED11) classifies all correspondents' educational degrees according to the "International Standard Classification of Education (ISCED)" of 2011 in order to make degrees internationally comparable. The variable is generated retrospectively From 2010 onwards taking into account degrees and diplomas attained in both general schooling and in vocational/university education and indicates the highest degree obtained. Note that for respondents from the newly introduced migration samples, we can differentiate between university degrees (Bachelor/Master/PhD) obtained in Germany. If the university degree was obtained abroad, the degree is counted as Bachelor, because further differentiation between university degrees abroad is only possible for a subgroup of migrants.

The following statements describe the standard computation for schooling. The school years and the additional vocational training are added together.

As can be seen, the assignment table are not very differentiated. For example, special schools for health care professions and other kinds of specialized schools are all included in the “technical school” label. However, in Germany, this assignment is the most commonly used one when earnings functions based on human capital theory are estimated.

schooling	years
no degree	7
lower school degree	9
intermediary school	10
degree for a professional college	12
high school degree	13

schooling	years
other	10

additional occupational training (includes universities)	years
apprenticeship	1.5
technical schools (incl. health)	2
civil servants apprenticeship	1.5
higher technical college	3
university degree	5

Waves: all

All respondents in all SOEP subsamples are asked about diplomas/degrees attained for completion of secondary/tertiary education (1984–1993 blue questionnaire; since 1994 biographical questionnaire) the first time they participate in SOEP. First: to generate this variable, the different diploma/degree categories provided for Subsamples B and D (see PGPSBILA) as well as C (see PGPSBILO) are integrated into the West German diploma/degree categories (Subsample A) and continued on in this form. Second: this data is regularly updated to take into account any changes in highest diploma/degree attained. With the survey of 2000, all educational information was collected again and is reflected in the variables.

For more information, contact: Peter Krause (Tel. +49-30-89789-690)

-8	Question this year not part of survey	64230

Waves: all

To supplement the variable PGPBBIL01 the highest secondary school degree/diploma in East Germany is provided as a separate variable and updated if necessary for 1991. Since 1992 only the West German version has been used for new vocational degrees. For new SOEP respondents, vocational degrees attained in the former GDR are asked as well; for old respondents, the same codes are carried forward. From 2002 on, the questionnaire was expanded and revised, but this led to an operationalization involving more assumptions on the vocational degrees attained in the GDR; (from 2002 on, Code 3 is also listed as the additional category Code 4 in the integrated variables PGPBBIL03 if this degree has not been replaced by a more recently attained, higher-level university or college degree).

Waves: -1985

The variable is designed to provide information on the field of education of tertiary degrees which adds details to the information recorded in the variable PGPBBIL02. While the latter variable records if a person holds a degree PGFIELD contains more detailed information on the type of the degree. The data of the generated variable PGFIELD stem from two sources:

1. Person questionnaire: Each year since 1985 respondents are asked if they have left education since the beginning of the year prior to the survey and which degrees they have obtained. This part of the questionnaire contains an open question on the type and the field of newly obtained tertiary degrees. This information is coded and used for the generation of the variable PGFIELD.
2. Biography questionnaire: Since 2001 similar information is collected from respondents who fill in the biography questionnaire (usually during the first two years of participation in the panel). In contrast to the information from the person questionnaire the questions do not refer to currently obtained degrees but to degrees obtained during the time before being part of the SOEP sample.

In the variable PGFIELD we combine these two types of information. However, since the retrospective information was not collected before 2001 the variable covers until 2000 only persons for whom we have prospectively observed the end of study. This explains why the number of valid observations is rather small in these years. Information on the data source is stored in the variable PGFDT_F.

Each year the variable contains the most recently collected information. Take for instance a person for whom we have observed a first degree in sociology in 1987 and a second degree in economics in 1991. For this person the variable PGFIELD would be filled as follows:

year	value
1984-1986	-2 does not apply
1987-1990	26 political/social science
1991-today	30 economics

If you want to take into account that a person holds two degrees you have to combine the information from all available years. However, only a minority of the population holds more

than one tertiary degree. In very few cases we encounter the problem that a respondent provides information on two different degrees in one survey year. This only happens in years when respondents fill in the person as well as the biography questionnaire. In these cases we prioritize the information from the person questionnaire as it refers to the current situation while the biography questionnaire contains retrospective information. Furthermore, there are cases who report an applied university degree and a university degree in the biography questionnaire. In these cases, the variable contains information on the university degree only. The variable is coded according to the classification on fields of education („Fächergruppen“) provided by the Statistisches Bundesamt (2009). Until 2009 data from the person questionnaire were coded using an earlier version of this classification (1982). In the variable PGFIELD we recoded the original values. As the newer version is more precise this could be done with hardly any loss of information. Some categories are collapsed. Category 3 is coded as 2 (no distinction between catholic and protestant theology), 14 as 13, 17 as 16, 24 as 23, 25 as 26 and 48 as 49. The original values of the data collected from the person questionnaire up to 2009 are stored in the respective variables in the dataset PL.

Please note that for respondents from the newly introduced migration sample a valid value to PGFIELD was only assigned if the tertiary degree was attained in Germany.

Waves: -1985

The variable is designed to provide information on the type of tertiary degree (e.g., Diploma, Bachelor, Master) which adds details to the information recorded in the variable PGPBBIL02. While the latter variable records if a persons holds a degree, PGDEGREE contains more detailed information on the type of the degree. The data of the generated variable PGDEGREE stem from two sources:

1. Person questionnaire: Each year since 1985 respondents are asked if they have left education since the beginning of the year prior to the survey and which degrees they have obtained. This part of the questionnaire contains an open question on the type and the field of newly obtained tertiary degrees. This information is coded and used for the generation of the variables PGDEGREE.
2. Biography questionnaire: Since 2001 similar information is collected from respondents who fill in the biography questionnaire (usually during the first two years of participation in the panel). In contrast to the information from the person questionnaire the questions do not refer to currently obtained degrees but to degrees obtained during the time before being part of the SOEP sample.

In the variable PGDEGREE we combine these two types of information. However, since the retrospective information was not collected before 2001 the variable covers until 2000 only persons for whom we have prospectively observed the end of study. This explains why the number of valid observations is rather small in these years. Information on the data source is stored in the variable PGFDT_F.

Each year the variable contains the most recently collected information. Take for instance a person for whom we have observed first an applied university diploma in 1987 and a university diploma in 1991. For this person the variables DEGREE\$\$ would be filled as follows:

year	value
1984-1986	-2 does not apply
1987-1990	21 diploma (applied university)
1991-today	12 diploma (university)

If you want to take into account that a person holds two degrees you have to combine the information from all available years. However, only a minority of the population holds more than one tertiary degree. In very few cases we encounter the problem that a respondent provides information on two different degrees in one survey year. This only happens in years when respondents fill in the person as well as the biography questionnaire. In these cases we prioritize the information from the person questionnaire as it refers to the current situation while the biography questionnaire contains retrospective information. Furthermore, there are cases who report an applied university degree and a university degree in the biography questionnaire. In these cases, the variables contain information on the university degree only.

The variable is coded according to a slightly collapsed version of the classification on types of tertiary degrees (“Prüfungsgruppen und Abschlussprüfungen”) provided by the Statistisches Bundesamt (2009). Until 2009, data from the person questionnaire were coded using an earlier version of this classification (1982) which was slightly revised in 2009 (inclusion of Bachelor and Master degrees). Since 2010 the data were coded according to the classification

presented here. In the variable PGDEGREE we recoded the original values from years 2009 and earlier. As the newer version is more precise this could be done with hardly any loss of information. Some categories are collapsed. Category 16 was mostly likely coded as 15 in earlier years, 34 as 35 and 43 as 44. The original values of the data collected from the person questionnaire up to 2009 are stored in the respective variables in the dataset \$P.

Please note that for respondents from the newly introduced migration sample a valid value to PGDEGREE was only assigned if the tertiary degree was attained in Germany.

Waves: -1985

The variable is designed to provide information on the occupation of vocational training which adds details to the information recorded in the variable PGPBBIL01. In addition to the variable PGTRAINA, we provide the variables PGTRAINB, PGTRAINC and PGTRAIND.

All these variables record the occupation of vocational training. The difference is that PGTRAINA contains information on vocational training within the German dual system which combines firm-based and school-based training (apprenticeship). PGTRAINB is designed to provide information on the occupation of full-time school based vocational training. PGTRAINC contains information on level vocational training (e.g., Meister, Techniker). PGTRAIND is designed to provide information on the occupation of civil servant training (“Beamtensausbildung”). We describe in brief detail the construction of the variables PGTRAINA, PGTRAINB, PGTRAINC and PGTRAIND are constructed in an analogous manner. The data of the generated variable PGTRAINA stem from two sources:

1. Person questionnaire: Each year since 1985 respondents are asked if they have left education since the beginning of the year prior to the survey and which degrees they have obtained. This part of the questionnaire contains an open question on the type and the field of newly obtained tertiary degrees. This information is coded and used for the generation of the variable PGTRAINA.
2. Biography questionnaire: Since 2001 similar information is collected from respondents who fill in the biography questionnaire (usually during the first two years of participation in the panel). In contrast to the information from the person questionnaire the questions do not refer to currently obtained vocational qualifications but to qualifications obtained during the time before being part of the SOEP sample.

In the variable PGTRAINA we combine these two types of information. However, since the retrospective information was not collected before 2001 the variable covers until 2000 only persons for whom we have prospectively observed the end of study. This explains why the number of valid observations is rather small in these years. Information on the data source is stored in the variable PGFDT_F.

Each year the variable contains the most recently collected information. Take for instance a person for whom we have observed a first vocational qualification as an electrician in 1987 and a second qualification as a car mechanic in 1991. For this person the variables PGTRAINA would be filled as follows:

year	value
1984-1986	-2 does not apply
1987-1990	31 electrical occupation
1991-today	28 automotive/flight industry occupation

If you want to take into account that a person holds two vocational qualifications you have to combine the information from all available years. In few cases we encounter the problem that a respondent provides information on two different apprenticeships in one survey year. This only happens once, namely in years when respondents fill in the person as well as the biography questionnaire. In these cases we prioritize the information from the person questionnaire as it refers to the current situation while the biography questionnaire contains retrospective information.

The variable is coded according to the classification of occupations at two-digit level („Berufsgruppen“) provided by the Statistisches Bundesamt (1992). Other SOEP occupation variables are coded at four-digit level. The reason why the variable PGTRAINA is provided at two-digit level only is that until 2009 the data from the two different sources were coded according two different classifications which could be combined at a higher level of aggregation only. The person questionnaire data were coded according to the classification of occupations provided by the Bundesanstalt für Arbeit (1988, four-digit level) while the biography data use

the classification provided by the Statistisches Bundesamt (1992, four-digit level). Since 2010 both types of data are coded according to the latter classification. The four-digit version of the biography data can be provided upon request. The original values of the data collected from the person questionnaire up to 2009 are stored in the respective variables in the dataset PL. Please note that for respondents from the newly introduced migration sample a valid value to PGTRAINA was only assigned if the vocational training was completed in Germany.

pgbiltzch – Change in Education since last survey / last year

0	Inconsistent educational information since last year	596339
1	Inconsistent educational information since last survey	1
2	Inconsistent educational information since last year	3335
-2	Does not apply	150765
-7	Only available in less restricted edition	0

Waves: -1985

This is a flag variable which identifies observations with inconsistent changes in the information on highest educational qualification compared to the previous observation or year. Questions on highest educational attainment have been asked in the first survey and were only updated in subsequent years if the respondent reported a change. In the year 2000, every single SOEP participant was asked his highest level of educational attainment which produced a number of inconsistencies between the most recent information from 2000 and the generated information from previous years. These inconsistencies include both higher and lower educational attainment and are not just due to repeating the question about educational attainment in 2000. They also occur more generally, although to a lower degree, in the second survey wave of new samples when respondents to individual and life history questionnaires are asked to state their educational attainment. In both situations, respondents are not only asked annual questions about any changes in educational attainment since the previous year, but are also asked to state their highest level of educational attainment.

In our view there is no means of unequivocally correcting for these inconsistencies. The flag variable helps researchers to identify observations with inconsistent answers to educational questions in the cross-sectional perspective. Researchers need to decide how to deal with these on a case-by-case basis depending on the research question at hand.

So far, we have not found evidence that respondents with a change in the year 2000 differed systematically from other respondents. One possible approach would be to exclude these individuals from the analysis when sample size allows. Alternatively, one could apply the information collected in 2000 to the prior years in which no changes were recorded between two years and test whether the results differ from those obtained when these individuals are left out.

File BIOEDU contains new data on consistent longitudinally tested educational transitions. For more information, contact: Charlotte Bartels (Tel. +49-30-89789-346)
